30 November 1998 (30.11.1998)

PCT/US99/26610 Applicant

TRUSTEES OF DARTMOUTH COLLEGE

- The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
- A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
- Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices)(Article 39(1))(see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

VIII. Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the questions whether the claims are fully supported by the description, are made:

Claims 1-5 are objected to as lacking clarity under PCT Rule 66.2(a)(v) because practice of the claimed invention is not enabled as required under PCT Rule 5.1(a) for the reasons set forth in the immediately preceding paragraph.

The claims are broadly drawn to a method of diagnosing or prognosticating a matrix metalloproteinase-1 related disease by detecting the matrix metalloproteinase-1 (MMP-1) containing the Ets transcription factor binding site single nucleotide polymorhism. The claims are also drawn to methods of identifying the apeutic agents for treatment of a MMP-1 related disease.

The specification teaches MMP-1 is associated with irreversible degradation of cartilage, tendon and bone in arthritis, degradation of collagenase I and III in tumor invasion and metastasis (pg. 1). Furthermore, the specification teaches that patients with tumors that express MMP-1 have a poor prognosis than patients with tumors that do not express this protein (pg. 2). The specification teaches that the full length DNA sequence with only 1 G at position -1607 constitutes a SNP (pg. 3). The specification teaches that while the SNP is not located in the coding region and does not alter the structure of the enzyme, it has profound effect on the production/regulation of the enzyme (pg. 4). The specification further teaches a study in which 100 hundred control DNA's were sampled to determine the frequency of the variation in the population (pg. 8). The specification teaches that the frequency of the 2G homozygotes in the controls was approximately 30% whereas the frequency in tumor cell lines was 62.5% (p<0.0001) (pg. 8). The specification provides several explanations which may explain the differences in expression such as growth factor and cytokines, specific nuclear factors within the cell (pg. 9).

The art teaches the a DNA sequence of the MMP-1 which only contained 1G at position -1607 (Rutter et al. J. Cell Biochem. 66: 322-336, 1997)(pg. 2). The art also teaches the sequence where 2Gs are located at this position (pg. 2). The consnsus sequence for a functional PEA3/EBS is provided in Graves (J.B. Science 279: 1000-1001, 1998).

It would be undue experimentaiton for the skilled artisan to practice the invention as broadly as claimed. The assertion that the MMP-1 EBS-SNP in patients is indicative of the patient suffering from a disease relating to overexpression of the MMP-1 enzyme is not supported by any clinical studies that provide this correlation. While the specification teaches that the frequency of the 2G homozygotes is expressed more frequency in tumor cell lines, this does not provide enablement for a method of diagnosing a MMP-1 related disease based upon the identification of the SNP. The study does not provide any data taken from patients with MMP-1 diseases, but rather amples cell lines. Cell lines are not representative of individuals with MMP-1 related diseases. Secondarily, the specification does not identify any specific disease which have been shown to be associated with the 2G polymorphism in the MMP-1. It would be undue experimentation for the skilled artisan to perform clinical studies to associate the single nucleotide polymorphism with a MMP-1 related disease. Additionally, the specification provides several plausible explanations as to the difference in expression. Thus, it is unpredictable whether the 2G polymorphism is associated with MMP-1 diseases or whether extrinsic factors affect the expression and disease characteristics.
